Feed Products and Pet Foods

Inspected — 1986

BY LESTER HANKIN

Chemical analysis of 463 official samples of feed products and pet foods collected during 1986 by inspectors of the Connecticut Department of Agriculture are presented in this Bulletin. One-hundred thirty-three are for farm animals. Although the 330 pet foods are mainly for cats and dogs, food for caged and wild birds and for fish is included.

Table 1 shows individual samples from 58 manufacturers. In the Table the brand names for individual products from each manufacturer are followed by the percentage guarantee for protein, fat, fiber, and in some cases ash. For example, the numbers, 11, 6, 1, 4 indicate that a minimum of 11% protein, a minimum of 6% fat, a maximum of 1% fiber, and a maximum of 4% ash are guaranteed. The analyses are then shown with deficiencies in protein and fat followed by a dash (-) and excesses in fiber and ash followed by a plus sign (+).

A summary is provided in Table 2 of the number of samples from each manufacturer and the number of guarantees for ash. The number of guarantees for protein, fat, and fiber is (except for two products with no guarantees) the same as the number of samples. Next is shown the percentage not meeting the guarantee for each nutrient, followed by the average percentage of guarantee for each nutrient.

Two types of variability affect feed and pet food analysis and must be considered in judging deficiencies. The first is the variability among different batches of the same product. This variability can be noted by examination of results of analyses on the same product from the same manufacturer. The second type of variability is among duplicate analyses of the same sample. This variability is shown by the statement: the mean difference between duplicates for protein, fat, fiber, and ash is about three-tenths percent.

Feed and pet food samples are deemed deficient in protein and fat and excessive in fiber and ash if the analysis is not within permitted variations recommended by the Association of American Feed Control Officials. For all samples tested only 1.3% were deficient in protein, 4.8% deficient in fat, 3.5% excessive in fiber, and 10.3% excessive in ash. In all, 10% of the samples examined were deficient in or contained an excess of a nutrient.

Analyses were by Helen Kocaba, Mamie Pyles, Mary Alice DeFrancesco, Jerry Smart, and Mary Withrow. Samples were collected by Marilyn Abt, John Chapman, Joseph Dippel, David Nisely, and Alton VanDyke under the direction of Kenneth Veit, Chief of the Marketing Division of the Department of Agriculture. Feed laws are administered by the Commissioner of the Connecticut Department of Agriculture.

Lester Hankin, Chief, Analytical Chemistry

The Connecticut Agricultural Experiment Station,

founded in 1875, is the first experiment station in America. It is chartered by the General Assembly to make scientific inquiries and experiments regarding plants and their pests, insects, soil and water, and to perform analyses for State agencies. The laboratories of the Station are in New Haven and Windsor; its Lockwood Farm is in Hamden. Single copies of bulletins are available free upon request to Publications; Box 1106; New Haven, Connecticut 06504.
